Agential conflicts and accounting reforms in ‘Less Developed Countries’:
The Case of the Nepalese Central Government

ABSTRACT
This paper aims at unveiling how external isomorphic factors promote reforms to the
government accounting system in Nepal, a unique ‘less developed county’ (LDC) without
fundamental measures of public administration and governance from the Western colonial
power in the history (remained independent throughout the history), and how internal factors,
such as the structures and human agencies at the organizational field and organizational levels
interact and respond. The paper draws on the framework of Dillard et al., (2004), which
combines neo-institutional theory with the dynamics of structuration theory. The findings of
the paper suggest that the Nepalese government accounting reforms, promoted by coercive,
mimetic, and normative pressures at the socio-economic and political level, struggle to create
a positive impact because of the historically established manipulation/fabrication and
non-compliance culture, as well as the dualist control structure at the organizational field and
organizational levels. Thus the unintended consequences, such as agential conflicts within the
context of the “dialectic of power” at these levels, indicate that any chance of a successful
institutionalization of the government accounting reforms in Nepal requires the empowerment
and active participation of influential agencies (such as, government accountants).

Keywords: Government accounting, International organizations, Neo-institutionalism, Nepal,
Structuration theory.
